

CLARION™

Advanced Antibiograms

Create dozens of antibiogram variations in just a few clicks to deliver reports that are dynamic, granular, and syndrome specific.

CLARION is the solution for labs and antimicrobial stewardship programs (ASP) looking to deliver clinically useful antibiogram information and trend dynamic AMR data for leadership. By tailoring to special patient populations or a specific hospital unit, ASPs can more effectively promote the right drug for the right patient as soon as possible.

CLARION is supported by infectious diseases (ID) pharmacists with real-world clinical experience who recognize the complexities associated with getting the data right.

Tracking susceptibility patterns and trends over time
susceptibility patterns over time may help identify
changes in empiric prescribing guidelines and may
impact formulary changes and ASP interventions.

Easily look at any number of drug-resistant organisms
and use the drop-down list of available drugs to
determine the most ideal therapy in near real-time and
using the most current data available.

Distinguish between organisms without and with
phenotypically expressed resistance mechanism.

CLARION allows for the ability to...

- Monitor alignment with breakpoints
- Monitor epidemiological cut-off values (ECOFF)
- Make improvements in the choice of empiric antibiotic treatment regimens for diseases state guidelines at local level
