CERTIFICAT UE DE SYSTEME DE GESTION DE LA QUALITE
Règlement (UE) 2017/746, Annexe IX chapitres I et III

EU QUALITY MANAGEMENT SYSTEM CERTIFICATE

Regulation (EU) 2017/746, Annex IX chapters I and III

Certificat/*Certificate:* N° 38817 rev. 15

Délivré le/*Issued on:* May 6th, 2025

Certificat délivré à/*Certificate issued to:* **BIOMERIEUX S.A.**

376, Chemin de l'Orme

69280 MARCY L ETOILE FRANCE

SRN: FR-MF-000004436

GMED atteste qu'à l'examen des résultats figurant dans le(s) rapport(s) d'audit du système de gestion de la qualité et le(s) rapport(s) d'évaluation de la documentation technique associé(s), le cas échéant, référencé(s) P602831 - P604661 - P604659, le système de gestion de la qualité est conforme aux dispositions pertinentes du règlement (UE) 2017/746 pour les produits suivants :

GMED certifies that, on the basis of the results listed in the quality management system audit report(s) and the associated technical documentation assessment report, where appropriate, referenced P602831 - P604661 - P604659, the quality management system complies with the relevant provisions of the regulation (EU) 2017/746 for the following products:

Dispositifs médicaux de diagnostic in vitro (trousses d'essai, réactifs, matériaux de contrôle, analyseurs et logiciels) destinés à être utilisés pour la culture, l'identification, la caractérisation des agents infectieux et les tests de sensibilité des agents antimicrobiens.

In vitro diagnostic medical devices (test kits, reagents, control materials, analyzers and software) intended to be used for culture, identification, characterization of infectious agents and susceptibility testing of antimicrobial agents.

Voir détails sur addendum / See addendum for additional information

Aux fins de la mise sur le marché de dispositifs de diagnostic in vitro de classe D, de diagnostics compagnons de classe C et de dispositifs de diagnostic in vitro d'autodiagnostic et de diagnostic près du patient de classe B et C, un autre certificat délivré conformément aux dispositions du règlement (UE) 2017/746 est requis. La validité du présent certificat est conditionnée au respect des obligations qui découlent du système de gestion de la qualité approuvé et de la surveillance effectuée par l'organisme notifié prévue par le règlement. Ce certificat est lié par les conditions du contrat.

For the purpose of placing on the market class D in vitro diagnostic devices, class C companion diagnostics and class B and C in vitro diagnostic devices for self-testing and near-patient testing, another certificate issued in accordance with the provisions of Regulation (EU) 2017/746 is required. The validity of this certificate is subject to compliance with the obligations arising from the approved quality management system and the surveillance carried out by the notified body as required by the regulation. This certificate is bound by the conditions of the contract.

Début de validité */Effective date:* May 6th, 2025 (included)

Valable jusqu'au */Expiry date:* April 5th, 2027 (included)

API® 10 S	10100	API® 10 S is a qualitative standardized system for the identification of Enterobacteriaceae and other non-fastidious Gram-negative rods. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually d the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software.	B
API® 20 A	20300	API® 20 A is a qualitative standardized system for the identification of anaerobes. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure -Information for Identification Software.	B

API® 20 C AUX	20210	API® 20 C AUX is a qualitative standardized system for the precise identification of the most frequently encountered yeasts. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software.	B
API® 20 E	20100 20160	API® 20 E is a qualitative standardized system for the identification of Enterobacteriaceae and other non-fastidious Gram-negative rods. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software.	B
API® 20 NE	20050	API® 20 NE is a qualitative standardized system for the identification of non-fastidious, non-enteric Gram-negative rods (for example, Pseudomonas, Acinetobacter, Moraxella, Vibrio, Aeromonas). It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software.	B
API® 20 Strep	20600	API® 20 STREP is a qualitative standardized system for the group or species identification of most streptococci and enterococci, and those most common related organisms. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure -Information for Identification Software.	B
API® Campy	20800	API® CAMPY is a qualitative standardized system for the identification of Campylobacter. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure -Information for Identification Software.	B
API® Candida	10500	API® CANDIDA is a qualitative standardized system for the identification in 18-24 hours of yeasts, notably those most frequently encountered in clinical microbiology. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software.	B

API® Coryne	20900	API® CORYNE is a qualitative standardized system for the identification of coryneform bacteria in 24 hours. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure -Information for Identification Software.	B
API® Listeria	10300	API® LISTERIA is a qualitative standardized system for the identification of Listeria. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software.	B
API® NH	10400	API® NH is a qualitative standardized system for the identification of Neisseria, Haemophilus (and related genera) and Moraxella catarrhalis (Branhamella catarrhalis). It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software. API® NH also enables the biotyping of Haemophilus influenzae and Haemophilus parainfluenzae, as well as the detection of a penicillinase.	B
API® Staph	20500	API® STAPH is a qualitative standardized system for the identification of the genera Staphylococcus, Micrococcus and Kocuria. It uses miniaturized tests as well as a specially adapted database. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure -Information for Identification Software.	B
BCP	70510	Reagent kit to be used with API® 20 A (20300), RAPID ID 32 E (32700) => refer to related Intended Use	B

ID 32 E	32400	ID 32 E is a qualitative standardized system for the identification of Enterobacteriaceae and other non-fastidious Gram-negative rods. It uses miniaturized tests as well as a specially adapted database. After manual inoculation of the strip, reading can be performed either automatically or manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software.	B
ID 32 GN	32100	ID 32 GN is a qualitative standardized system for the automatic identification of Gram negative rods. It uses miniaturized assimilation tests as well as a specially adapted database. After manual inoculation of the strip, reading is performed automatically and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure -Information for Identification Software.	B
ID 32 STAPH	32500	ID 32 STAPH is a qualitative standardized system for the identification of the genera Staphylococcus, Micrococcus and related genera, Rothia and Aerococcus. It uses miniaturized tests as well as a specially adapted database. After manual inoculation of the strip, reading can be performed either automatically or manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure -Information for Identification Software.	B
JAMES	70542	Reagent kit to be used with API® NH (10400), API® 20 E (20100/20160), API® 10 S (10100), RAPID 20 ETM (20701), API® 20 NE (20050), ID 32 E (32400), RAPID ID 32 A (32300), RAPID ID 32 E (32700) => refer to related Intended Use	B

ETEST® Benzylpenicillin (PG) (0.016-256 µg/mL)	412263	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE ETEST® PG can be used to determine the MIC of Benzylpenicillin against the following microorganisms: • Aerobes: ◦ Gram-positive aerobes: Staphylococcus, Enterococcus • Anaerobes: ◦ Gram-negative anaerobes: Bacteroides, Fusobacterium ◦ Gram-positive anaerobes: Clostridium, non-sporeforming Gram-positive rods, Gram-positive cocci	B
ETEST® Benzylpenicillin (PG) (0.002-32 µg/mL)	412265	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE ETEST® PG can be used to determine the MIC of Benzylpenicillin against the following microorganisms: • Streptococci (β-hemolytic and viridans group) • Streptococcus pneumoniae • Neisseria gonorrhoeae	B

ETEST® Minocycline (MC) (0.016-256 µg/mL)	412409	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE ETEST® MC can be used to determine the MIC of Minocycline against the following microorganisms: • Aerobes: ◦ Gram-negative aerobes: Enterobacterales, Stenotrophomonas maltophilia, Pseudomonas, Acinetobacter ◦ Gram-positive aerobes: Staphylococcus, Enterococcus	B
ETEST® Vancomycin (VA) (0.016-256 µg/mL)	412488	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE ETEST® VA can be used to determine the MIC of Vancomycin against the following microorganisms: • Aerobes: ◦ Gram-positive aerobes: Staphylococcus, Enterococcus • Streptococcus spp. • Streptococcus pneumoniae	B

ETEST® Imipenem/Relebactam (IPR) (0.002-32/4 µg/mL)	420925	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE Imipenem/Relebactam has been shown to be active against the Gram-negative aerobic microorganisms listed below according to the EMA or FDA labels for this antimicrobial agent. ETEST® IPR can be used to determine the MIC of Imipenem/Relebactam against the following microorganisms: Active both in vitro and in clinical infections: • Aerobes: o Gram-negative aerobes: - Citrobacter freundii - Enterobacter cloacae/Enterobacter cloacae complex - Escherichia coli - Klebsiella aerogenes - Klebsiella oxytoca - Klebsiella pneumoniae	B
ETEST® Piperacillin/Tazobactam (P/T) (0.016-256/4 µg/mL)	421166	ETEST® is a manual, quantitative technique for determination of antimicrobial susceptibility of both non-fastidious Gram negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE Piperacillin/Tazobactam has been shown to be active against the Gram-negative aerobic microorganisms listed below according to the EMA or FDA label for this antimicrobial agent. ETEST® P/T can be used to determine the MIC of Piperacillin/Tazobactam against the following microorganisms: Active both in vitro and in clinical infections: Enterobacteriaceae ;Pseudomonas aeruginosa ;Acinetobacter spp.	B

ETEST® Metronidazole (MZ) (0.016-256 µg/mL)	412404	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE ETEST® MZ can be used to determine the MIC of Metronidazole against the following microorganisms: • Anaerobes: ◦ Gram-negative anaerobes: Bacteroides, Fusobacterium ◦ Gram-positive anaerobes: Clostridium, non-sporeforming Gram-positive rods, Gram-positive cocci	B
ETEST® Teicoplanin (TP) (0.016-256 µg/mL)	412461	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE ETEST® TP can be used to determine the MIC of Teicoplanin against the following microorganisms: • Aerobes: ◦ Gram-positive aerobes: Staphylococcus aureus, Enterococcus	B
ETEST® Tobramycin (TM) (0.016-256 µg/mL)	412479	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE ETEST® TM can be used to determine the MIC of Tobramycin against the following microorganisms: • Aerobes: ◦ Gram-negative aerobes: Enterobacterales, Pseudomonas aeruginosa, Acinetobacter ◦ Gram-positive aerobes: Staphylococcus aureus	B

ETEST® Ceftazidime/Avibactam (CZA) (0.016-256/4 µg/mL)	419556	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. INDICATIONS FOR USE Ceftazidime/Avibactam has been shown to be active against the Gram-negative aerobic microorganisms listed below according to the EMA and/or FDA labels for this antimicrobial agent. ETEST® CZA can be used to determine the MIC of Ceftazidime/Avibactam against the following microorganisms: Active both in vitro and in clinical infections: • Gram-negative aerobes: ◦ Enterobacterales: ▪ Citrobacter freundii ▪ Enterobacter cloacae ▪ Escherichia coli ▪ Klebsiella oxytoca ▪ Klebsiella pneumoniae ▪ Proteus mirabilis ▪ Serratia marcescens ◦ Pseudomonas aeruginosa In vitro data are available for the following microorganisms, but clinical significance is unknown: • Citrobacter koseri • Enterobacter aerogenes • Morganella morganii • Providencia rettgeri • Providencia stuartii (FDA only) • Proteus vulgaris (EMA only)	B

API® 50 CH	50300	API® 50 CH is a qualitative standardized system, associating 50 biochemical tests for the study of the carbohydrate metabolism of microorganisms. API® 50 CH is used in conjunction with API® 50 CHL Medium for the identification of Lactobacillus and related genera and with API® 50 CHB/E Medium for the identification of Bacillus and related genera, Enterobacteriaceae, and Vibrionaceae. Inoculation and reading of the strip are performed manually and the identification is obtained using an identification software. The complete list of those organisms that it is possible to identify with this system is given in the Technical Brochure - Information for Identification Software.	B
API® 50 CHL Medium	50410	API® 50 CHL Medium, intended for the identification of the genus Lactobacillus and related genera, is a ready-to-use medium which allows the study of the fermentation of the 49 carbohydrates on the API® 50 CH strip.	B

API® 50 CHB/E Medium	50430	API® 50 CHB/E Medium is intended for the identification of Bacillus and related genera, as well as Gram-negative rods belonging to the Enterobacteriaceae and Vibrionaceae families. It is a ready-to-use medium which allows the study of the fermentation of the 49 carbohydrates on the API® 50 CH strip. Note: Genera formerly included in the family Enterobacteriaceae were reorganized to an order (Enterobacterales) containing seven families: Budviciaceae, Enterobacteriaceae, Erwiniaceae, Hafniaceae, Morganellaceae, Pectobacteriaceae, Yersiniaceae. Therefore, the bacterial species identified belong to the family Enterobacteriaceae and to one or more species in the other families mentioned.	B
RAPIDEC® CARBA NP	415418 417498	The RAPIDEC® CARBA NP test is a ready-to-use qualitative standardized system for the rapid detection of Carbapenemase producing Gram-negative bacilli such as Enterobacterales, Pseudomonas aeruginosa and Acinetobacter baumannii, using bacteria cultured on an agar medium.	B
CHROMID® CPS® Elite Agar (CPSE)	418284 416172	CHROMID® CPS® Elite agar is an isolation, enumeration and identification medium for urine specimens. This medium enables: • the microbial enumeration of the specimen by means of standardized inoculation methods. • the direct identification of Escherichia coli • the presumptive identification of the following bacterial species or genera: - Enterococcus, - Klebsiella, Enterobacter, Serratia, Citrobacter (KESC), - Proteus, Providencia, Morganella (Proteeae).	B
CHROMID® CPS® Elite Agar (CPSO)	418206 416173	CHROMID® CPS® Elite agar is an isolation, enumeration and identification medium for urine specimens. This medium enables: • the microbial enumeration of the specimen by means of standardized inoculation methods. • the direct identification of Escherichia coli • the presumptive identification of the following bacterial species or genera: - Enterococcus, - Klebsiella, Enterobacter, Serratia, Citrobacter (KESC), - Proteus, Providencia, Morganella (Proteeae). Nom commercial du dispositif *Device trade name*	Références commerciales *Commercial references*	Destination* du dispositif *Intended purpose* of the device*	Classe du dispositif *Device classification*
CHROMID® MRSA agar	43451 43459	Chromogenic medium for the screening of methicillin-resistant Staphylococcus aureus (MRSA). This chromogenic medium is intended for the screening of methicillin-resistant S. aureus (MRSA) in chronic carriers or patients who are at risk for MRSA. This medium does not replace conventional antimicrobial susceptibility tests. MRSA are multi-resistant bacteria which may cause nosocomial infections. The detection of MRSA carriers is particularly important for the epidemiological prevention and monitoring of these infections. In this context, the use of this medium contributes towards the active surveillance of MRSA.	C
CHROMID® Strepto B agar	43461	Selective chromogenic medium for the screening of group B streptococci (S. agalactiae). This selective chromogenic medium is intended for the screening of S. agalactiae carriage in pregnant women specimens. S. agalactiae can cause serious and potentially fatal infections in newborns. Detection of S. agalactiae carriage in pregnant women allows antimicrobial prophylaxis to be administered at the time of delivery to prevent perinatal infections.	C
CHROMID® VRE agar	43004	Selective chromogenic medium for the detection and differentiation of Enterococcus faecium and Enterococcus faecalis showing acquired vancomycin resistance (VRE). CHROMID® VRE Agar is a selective chromogenic medium for the detection of E. faecium and E. faecalis showing acquired vancomycin resistance (VRE) in at risk patients. It enables the differentiation of E. faecium and E. faecalis. The E. faecium and E. faecalis with acquired vancomycin resistance (mainly genotypes vanA and vanB are multi-resistant bacteria which can be responsible for health care-associated infections. The detection of this resistance is particularly important for the prevention and epidemiological surveillance of these infections and also to prevent the emergence of vancomycin-resistant Staphylococcus aureus (VRSA), by transmission of the vanA gene. This medium is not a substitute for the conventional antimicrobial susceptibility test methods.	C
GRANADA™ AGAR	43712	Selective medium for the screening and identification of group B streptococci (S. agalactiae). This selective medium is intended for the screening and direct identification of Streptococcus agalactiae carriage in pregnant women and newborns using clinical specimens. The medium was first described by Dr De La Rosa et al. It was developed from the previous work of A.K.M.S Islam and Dr De La Rosa. S. agalactiae are responsible for serious infections in newborns (meningitis). Their detection is particularly important for the prevention, treatment, and monitoring of infections.	C

ETEST® Anidulafungin (AND) (0.002-32 µg/mL)	423998	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of yeasts and moulds. The system comprises a predefined antifungal gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. ETEST® AND can be used to determine the MIC of Anidulafungin against the following microorganisms: • Yeasts: Candida spp. • Moulds: Aspergillus spp., Fusarium spp., Rhizopus spp.	B
ETEST® Ceftaroline (CPT) (0.002-32 µg/mL)	424000	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. ETEST® CPT can be used to determine the MIC of Ceftaroline against the following microorganisms: • Aerobes: ◦ Gram-positive aerobes: Staphyloccocus aureus • Streptococcus pneumoniae • Streptococcus agalactiae • Haemophilus influenzae	B
ETEST® Gentamicin (GM) (0.064-1024 µg/mL)	424004	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. ETEST® GM can be used to determine the MIC of Gentamicin against the following microorganisms: • Aerobes: ◦ Gram-positive aerobes: Enterococcus* * suitable for the detection of high-level aminoglycoside resistance (HLAR)	B

ETEST® Imipenem/Relecbactamn (IPR) (0.002-32/4 µg/mL)	423988	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. Imipenem/Relebactam has been shown to be active against the Gram-negative aerobic microorganisms listed below according to the EMA or FDA labels for this antimicrobial agent. ETEST® IPR can be used to determine the MIC of Imipenem/Relebactam against the following microorganisms: Active both in vitro and in clinical infections: • Citrobacter freundii • Enterobacter cloacae/Enterobacter cloacae complex • Escherichia coli • Klebsiella aerogenes • Klebsiella oxytoca • Klebsiella pneumoniae	B
ETEST® Micafungin (MYC) (0.002-32 µg/mL)	424008	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of yeasts. The system comprises a predefined antifungal gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. ETEST® MYC can be used to determine the MIC of Micafungin against the following microorganisms: • Yeasts: Candida spp.	B
ETEST® Mupirocin (MU) (0.064-1024 µg/mL)	424011	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. ETEST® MU can be used to determine the MIC of Mupirocin against the following microorganisms: • Aerobes: ◦ Gram-positive aerobes: Staphylococcus	B

CHROMID® S.aureus Elite agar	419042	This chromogenic medium is intended for the selective isolation and the direct identification of S. aureus in human specimens: • in 18 to 24 hours for the following specimens: blood cultures, nasal swabs, suppurations, ear/nose/throat samples, genital samples, stool samples, skin samples from serious burn victims, respiratory samples (including respiratory samples from patients with cystic fibrosis), • and up to 48 to 72 hours for respiratory samples from patients with cystic fibrosis. This medium is intended for the prevention and diagnosis of S. aureus infections using samples of human origin.	C
CHROMID® P. aeruginosa Agar	43462	This medium is intended for the direct identification of Pseudomonas aeruginosa in pulmonary specimens. Pseudomonas aeruginosa is the primary cause of nosocomial pneumopathies. It is also responsible for chronic infections in cystic fibrosis patients.	C
ETEST® Cefoxitin (FX) (0.016-256 µg/mL)	423826 412285	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. ETEST® FX can be used to determine the MIC of Cefoxitin against the following microorganisms: • Aerobes: ◦ Gram-negative aerobes: Enterobacterales ◦ Gram-positive aerobes: Staphylococcus • Anaerobes: ◦ Gram-negative anaerobes: Bacteroides, Fusobacterium ◦ Gram-positive anaerobes: Clostridium, non-sporeforming Gram-positive rods, Gram-positive cocci	B

ETEST® Rifampicin (RI) (0.002-32 µg/mL)	412450 423825	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. ETEST® RI can be used to determine the MIC of Rifampicin against the following microorganisms: • Aerobes: ◦ Gram-positive aerobes: Staphylococcus, Enterococcus • Streptococcus pneumoniae	B
ETEST® Piperacillin (PP) (0.016-256 µg/mL)	412436	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. ETEST® PP can be used to determine the MIC of Piperacillin against the following microorganisms: • Aerobes: ◦ Gram-negative aerobes: Enterobacterales, Acinetobacter	B
VITEK® MS KB 3.3	424203	VITEK® MS is a mass spectrometry system using matrix-assisted laser desorption/ionization time of flight mass spectrometry (MALDI-TOF MS) for the identification of microorganisms cultured from human specimens. The VITEK® MS System is a qualitative in vitro diagnostic device used in conjunction with other laboratory tests to aid in the diagnosis of bacterial, yeast and mould infections.	B
ETEST® ESBL Ceftazidime/Ceftazidime + Clavulanic Acid (TZ/TZL) (0.5-32/0.064-4 µg/mL)	423992	ETEST® ESBL Cefotaxime/Cefotaxime + Clavulanic Acid (CT/CTL) and ETEST® ESBL Ceftazidime/Ceftazidime + Clavulanic Acid (TZ/TZL) strips are designed to confirm the presence of Clavulanic Acid inhibitable ESBL (Extended Spectrum β-Lactamase) enzymes in Enterobacterales using a manual, qualitative technique. The suspected presence of ESBL in strains with phenotypic susceptibility patterns, where Minimum Inhibitory Concentration (MIC) values of Aztreonam, Cefotaxime, Ceftazidime, Ceftriaxone or Cefpodoxime are ≥ 1 µg/mL, should be confirmed using both ETEST® ESBL CT/CTL and ETEST® ESBL TZ/TZL strips. ETEST® ESBL CT/CTL and ETEST® ESBL TZ/TZL can be used to confirm the presence of Clavulanic Acid inhibitable ESBL (Extended Spectrum β-lactamase) enzymes in the following microorganisms: Enterobacterales: Escherichia coli, Klebsiella spp.	B

Mueller Hinton E Agar (MHE)	413822 413824 413825	Study of antimicrobial susceptibility. Mueller Hinton E Agar is a medium for disk diffusion antimicrobial susceptibility testing and the determination of Minimal Inhibitory Concentrations (MIC) using the ETEST® method. The medium has been developed according to EUCAST (European Committee on Antimicrobial Susceptibility Testing) and CLSI (Clinical Laboratory and Standards Institute, Inc.) recommendations.	B
CHROMID® SMART MRSA / S. AUREUS (MRSM/SAIDE)	419398	Chromogenic medium for the screening of methicillin-resistant Staphylococcus aureus (MRSA) and Chromogenic medium for the selective isolation and the direct identification of S. aureus. This product consists of two culture media, dispensed into one Petri dish containing separate compartments. CHROMID® MRSA SMART (MRSM) Agar. This medium is a chromogenic medium for the screening of methicillin-resistant S. aureus (MRSA) in chronic carriers or patients at risk of carriage. This medium does not replace conventional antimicrobial susceptibility tests for the diagnosis of methicillin resistance. MRSA are multi-resistant bacteria which may cause nosocomial infections. The detection of MRSA carriers is particularly important for the epidemiological prevention and monitoring of these infections. In this context, the use of CHROMID®MRSA SMART Agar contributes towards the active surveillance of MRSA. CHROMID® S. aureus Elite (SAIDE) Agar. This chromogenic medium is intended for the selective isolation and the direct identification of S. aureus in 18 to 24 hours for the following human specimens: nasal swabs, suppurations, ear/nose/throat samples, skin samples from serious burn victims. This medium is intended for the prevention and diagnosis of S. aureus infections using samples of human origin.	C
ETEST® Sulbactam/Durlobactam (SUD) (0.004/4-64/4 µg/mL)	423575	ETEST® is a manual, quantitative technique for the determination of antimicrobial susceptibility of non-fastidious Gram-negative and Gram-positive aerobic bacteria and fastidious bacteria. The system comprises a predefined antibiotic gradient which is used to determine the Minimum Inhibitory Concentration (MIC, in µg/mL) of different antimicrobial agents against microorganisms tested on agar media after overnight incubation. Sulbactam/Durlobactam has been shown to be active against the Gram-negative aerobic microorganisms listed below according to the FDA label for this antimicrobial agent. ETEST® SUD can be used to determine the MIC of Sulbactam/Durlobactam against the following microorganisms: • Acinetobacter baumannii-calcoaceticus complex	B
VITEK® 2 AST-N399	423701	The VITEK® 2 Gram-negative Susceptibility Card is intended for use with the VITEK® 2 Systems in clinical laboratories as an in vitro test to determine the susceptibility of clinically significant aerobic Gram-negative bacilli to antimicrobial agents when used as instructed.	B
